Reviewer's report

Title: Quantitative electroencephalography reveals different physiological profiles between benign and remitting-relapsing multiple sclerosis patients

Version: 1 Date: 17 July 2008

Reviewer: Antonio Gambardella

Reviewer's report:

This report is of some interest, but the major concern is that the authors did not correlate their findings with MRI features.

Other points:
- The paper is too long and should be significantly shortened.
- Figure 1 should be omitted.
- The manuscript should be edited for fluency in English.
