Reviewer's report

Title: Haemorrhagia post partum; an implementation study on the evidence-based guideline of the Dutch Society of Obstetrics and Gynaecology (NVOG) and the MOET (Managing Obstetric Emergencies and Trauma-course) instructions; the Fluxim study

Version: 4 Date: 7 November 2009

Reviewer: Justus Hofmeyr

Reviewer's report:

Discretionary Revisions
The authors may wish to consider one additional revision. As I understand the protocol, in the first study of actual practice, participants who do not agree to video recording of the birth will be compared to those who do agree, to assess the effect of video recording on practice. However, as these would be self selected groups, it would be difficult to assume that differences were due to the videorecording. If it is important to the researchers to know the effect of video recording, it would be preperable to study only participants who agree to videorecording, and to randomly allocate them to a group who have videorecording and a group who do not.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.

Declaration of competing interests:
