Title: Inability to predict postpartum hemorrhage: Insights from an Egyptian prospective cohort study

Version: 1 Date: 22 September 2011

Reviewer: Hani Tamim

Reviewer's report:

This is a nicely written paper about an important topic. My comments are the following:

1- The objectives of the study are not clearly stated at the end of the Introduction or Background section.

2- Although the original study has been published in other work, it is good to provide a summary of the main objective of the original project, as well as a summary of the findings.

3- The study design of this and the original study need to be specified. Was it analyzed as a case-control study, or what?

4- More details about the regression analyses is needed, was it a stepwise? Moreover, it needs to specify that the Odds Ratios were provided as the measure of effect.

5- The last sentence of the methods section does not belong to where it is, it might be more appropriate somewhere in the background.

6- The 95% confidence interval would be better provided in table 1. Moreover, the p-value should be specified as <0.0001 instead of 0.000
