Reviewer's report

**Title:** Limiting the Caesarean Section rate in low risk pregnancies is key to lowering the trend of increased abdominal deliveries: an observational study

**Version:** 2  **Date:** 25 October 2011

**Reviewer:** OFFER EREZ

Reviewer's report:

I have read the revised version of the manuscript entitled "Limiting the Caesarean Section rate in low risk pregnancies is key to lowering the trend of increased abdominal deliveries: an observational study".

The revised version did not address my major comment that the data should be analyzed as a longitudinal data rather than two isolated time points. Thus, to my opinion this manuscript does not contribute in its current format a novel information to the literature and I would recommend it acceptance only after the authors will address the issue of the longitudinal analysis.
