Reviewer's report

Title: An Issue of Unwanted Births in India: An Application of Conditional Logistic Regression

Version: 1 Date: 18 June 2012

Reviewer: Vijay Kumar Tiwari

Reviewer's report:

I have gone through the article. To me the term 'unwanted birth' is well defined in the article as per the international literature. The authors have used unconditional and conditional logistic regression analysis under matched case contro design. The data used for the article is from the National Family Health Survey which quality is unquestionable. Finding based on logistic regression is described appropriately. The discussion and conclusion in the article is based on the analysis and finding of the other nationa and international published work on similar topic. The review of literature is up to mark. The language is well balanced and suitable for publication. Writing is acceptable. The authors have clearly mentioned limitation of the present research work with due acknowledgement.

However, i would suggest to slightly revise the title as "Unwanted Births in India: Issues and challenges " which authors may or may not accept.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
