Reviewer's report

Title: Misoprostol for postpartum hemorrhage prevention at home birth: An integrative review of global implementation experience to date

Version: 2 Date: 15 January 2013

Reviewer: Nancy L L Sloan

Reviewer's report:

The manuscript presents important information, and in recognition of that, I support its acceptance, and thus make only suggestions for discretionary revisions. The authors integrative approach to analysis continues to be statistically and inferentially weak, and the paper would be improved by providing the simple point estimates suggested by the other reviewer (as numerators and denominators are needed for the presented range calculations as well as for the requested point estimates). The authors then could explain the caveats associated with more traditional point estimates. It also would have been preferable to broadly edit the manuscript which could be accomplished in the manner both reviewers suggested without loss of content. Such editing would improve the clarity of the manuscript which is unnecessarily long and detracts from conveying the main messages. I will hope that the authors recognize these suggestions would improve presentation and receptivity of their enormous work and that the journal's editorial staff can help them achieve more concise composition.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
