Reviewer’s report

Title: Intravenous ferric carboxymaltose for anaemia in pregnancy

Version: 1 Date: 27 November 2013

Reviewer: Robert Powers

Reviewer’s report:

In their manuscript Froessler et al. describe their prospective investigation of ferric carboxymaltose in the treatment of peri-partum iron deficiency anemia. The authors report a significant increase in maternal hemoglobin values following ferric carboxymaltose treatment and this treatment appears safe and effective.

One minor comment, the manuscript would be greatly strengthened by the inclusion of other measures of anemia including serum iron, serum ferritin and transferrin saturation.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
