Minor Essential Revisions:
1) When we looked at the exposure to fasting trimester groups, only 11 (8.6%) pregnant of fasting group were at third trimester. Best to our knowledge, Fetuses frequently are affected by food or fluid intake in third trimester. This is also affect the birth weight of fetsuses. So this need to state in the limitation part of manuscript.

2) Offspring health outcomes pass in some part of the manuscript. When we mention fetal outcomes, we don't understand only fetal birth weight and preterm delivery. We also understand APGAR scores, Neonatal intensive care unit admission, infant feeding. So especially the caption of Table 3 not to be Birth outcomes by fasting. The authors need to change it as Birth weight and week (exp.)

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
