Reviewer's report

**Title:** Sero-prevalence of rubella and associated factors among pregnant women attending antenatal care in Mwanza, Tanzania

**Version:** 2  **Date:** 29 October 2013

**Reviewer:** Yavuz Uyar

**Reviewer's report:**

Introduction and discussion sections should be extended by the authors. Especially, the risk factors and results should be discussed in the discussion. And also, neighbor countries’ results and their political approaches to rubella issues should be added, evaluate and discussed.

What is the immunization approach of Tanzania about rubella, past – today - future?

The authors have been found one IgM positive result. Is the result is confirmed by same or other methods (neutralization, avidity, PCR, etc..)? The positivity is important for pregnancy. The positivity should be discussed in the ms. What is her last status for positivity? IgG?, avidity? PCR?

As a result, the manuscript has been evaluated and the article should be rewritten.
