Reviewer's report

Title: TTFields alone and in combination with chemotherapeutic agents effectively reduce the viability of MDR cell sub-lines that over-express ABC transporters

Version: 1 Date: 9 February 2010

Reviewer: Zhiguo Liu

Reviewer's report:

In current study, Schneiderman RS et al demonstrated that by applying alternating electric fields (TTFields), drug-resistant cancer cells can be sensitized to chemotherapy reagents. While their findings are interesting and potentially of importance, authors have published several papers on the same issue. Given the fact that no significant scientific advancement have been achieved, a rejection would be suggested, please check the following references.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
