Reviewer’s report

**Title:** Inhibition of Radiation Induced Migration of Human Head and Neck Squamous Cell Carcinoma by Blocking EGF Receptor Pathways

**Version:** 3  **Date:** 6 October 2010

**Reviewer:** Maria Sundvall

**Reviewer’s report:**

Although the authors have been able to address some of the comments moderately, the revised manuscript still contains inconsistencies and errors. Language corrections and more updating are still required. The text is not yet comprehensive. There are mistakes and inaccuracies in the use of references. For example, reference 15 and 36 are the same. Moreover, presentation of results still needs improving (see e.g. MTT assay results). In Figure 7, tubulin blot contains 13 lanes, although 12 samples were analyzed with other antibodies and total protein levels are not included. Unfortunately the revised version of the manuscript does not meet the expectations of this journal and is not recommended for publication in BMC Cancer.
