Reviewer’s report

Title: Atypical Primary Meningioma in the Nasal Septum with Malignant Transformation and Distant Metastasis

Version: 1 Date: 20 March 2012

Reviewer: Alex Alfieri

Reviewer’s report:

In this well-conceived paper, the Authors report the clinical, radiological, and pathological features of an atypical PEMs originating in the nasal septum. The initial symptom of epistaxis, the histological diagnosis of atypical meningioma WHO grade 3, the multiple metastases, and the exceptional quick fatal progress give contribute to make this case significant for a case report.

Nevertheless, I have some minor points of concern.

1. Please state of the previous history was uneventful. (no previous radiation therapy? Work-related pathologies…)
2. The discussion is too long and unsettled. Please compact it

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
