Reviewer's report

**Title:** Androgenic suppression combined with radiotherapy for the treatment of prostate adenocarcinoma: a systematic review

**Version:** 1  **Date:** 10 October 2011

**Reviewer:** Yoshitomo Chihara

**Reviewer's report:**

The authors presented a benefit of combined long-term ADT and EBRT for high-risk PCa patients by the meta-analysis. The studies for the meta-analysis were carefully selected, and the results were discussed well. Indeed, the evaluation of radiotherapy for PCa patients in long-term follow-up period are difficult, because a total dose of radiation have been to change with the times. One general criticism, although the authors presented "Designed therapy" in Table3, they should add the items of results and median follow-up times, and summarize the whole studies for readers easy to follow.

**Level of interest:** An article of importance in its field

**Quality of written English:** Acceptable

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
