Title: Combined ANT2 shRNA and hNIS radionuclide gene therapy generates enhanced antitumor effects through phenotype modulation of cancer cells and increases CTL immune response simultaneously

Version: 2 Date: 9 November 2012

Reviewer: Catherine Brenner

Reviewer's report:

I read the manuscript entitled Combined ANT2 shRNA and hNIS radionuclide gene therapy generates enhanced antitumor effects through phenotype modulation of cancer cells and increases CTL immune response simultaneously 'Yun Choi, Ho Won Lee, Jaetae Lee and Yong Hyun Jeon and recommend it for publication without revision. To my knowledge, the results are original, the manuscript is well written and then, should be of high interest for the readers of BMC cancer.
