Reviewer's report

Title: The combination of ANT2 shRNA and hNIS radioiodine gene therapy increases CTL cytotoxic activity through the phenotypic modulation of cancer cells

Version: 3 Date: 7 December 2012

Reviewer: Dongmei He

Reviewer's report:

The authors have revised their manuscript. So, the article improved a lot. But I want to point out the clonogenic assay (additional experiment) is not used to determine cell apoptosis, as the authors said in the text of the article, the method is used to evaluate the survival and proliferation of cells.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.

Declaration of competing interests:

I declare that I have no competing interests.
