Reviewer's report

Title: Early results of prostate cancer radiation therapy: An analysis with emphasis on research strategies to improve treatment delivery and outcomes

Version: 2 Date: 1 November 2012

Reviewer: Yoshitomo Chihara

Reviewer's report:

The authors showed that disease presentation and early clinical outcomes for cohort of patients with prostate cancer treated with EBRT in Ghana.

Of all patients referred to KBTH for treatment, 69.6% had initial PSA >20 ng/ml. Furthermore, A total of 128 men, representing 33.8% of the overall cohort, were diagnosed with metastatic disease at the time of referral.

There are few key points need to be addressed before accepting for publications.

Major Compulsory Revisions
1) In patient selection section, the authors described about the patients treated with EBRT, brachytherapy, and ADT. There is no patient treated with radical prostatectomy?
The authors should mention why all patients with non-metastatic disease were treated with not radical prostatectomy, but EBRT, brachytherapy or ADT.

Minor Essential Revisions
1) Authors should explain what the dotted line and the solid line shown in figure1.
2) In FFbF analysis cohort, authors should mention about the median ADT time.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
