Reviewer’s report

Title: Wnt Signaling in Triple Negative Breast Cancer is Associated with Metastasis

Version: 4 Date: 12 September 2013

Reviewer: Caterina Marchiò

Reviewer’s report:

The authors have responded to all major issues raised by the reviewers and the manuscript has largely improved.

I would now recommend publication, however my only suggestion, for the sake of understatement, is to temper the conclusion at the end of the discussion. It is true that the authors have added functional work, however please note that the functional analysis was performed on one cell line only, without control cell lines (such as not triple negative to compare the effect). Therefore I would suggest something like “The results of the study MAY have implications for therapeutic target identification…. ” And possibly mention that the functional data would benefit from validation in other in vitro models. It is a minor amendment that can depict the scenario in a more realistic way according to my opinion.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
