Reviewer's report

**Title:** Complete Pathologic Response of HER2-Positive Breast Cancer Liver Metastasis with Dual Anti-HER2 Antagonism

**Version:** 1 **Date:** 16 December 2013

**Reviewer:** Scott Albert

**Reviewer's report:**

The authors have written a very polished case report on the use of dual anti-HER2 therapy in metastatic breast cancer. The authors report on a patient who after receiving dual anti-HER2 therapy went on to surgery and there was both a pathologic complete response in the breast and liver. This information is important in the treatment of metastatic breast cancer and offers hope for surgical intervention in select patients with Stage IV breast cancer.

**Minor essential revisions**

1. please review the figure legends and images. Several images do not have labels. There is a Fig 7 but no figure legend numbered 7.

**Discretionary revisions**

1. what was the timeframe between the MRM and liver resection. Did the pt receive any additional treatment between surgeries?

**Level of interest:** An article of importance in its field

**Quality of written English:** Acceptable

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
