Reviewer's report

Title: Clinical and prognostic significance of preoperative plasma hyperfibrinogenemia in gallbladder cancer following surgical resection

Version: 2
Date: 6 June 2014
Reviewer: Jin-Ming Yang

Reviewer's report:

This study evaluated and analyzed the pathological significance of hyperfibrinogenemia and its prognostic relevance for patients with GBC, using clinical specimens and medical records. The authors also determined the relationship between fibrinogen and the migration of GBC cells in vitro. With results of both clinical investigation and laboratory experiments, this report provides very important evidence and useful information about the value of the preoperative plasma hyperfibrinogenemia in gallbladder cancer following surgical resection. Overall, this study was well designed and carried out, and the results were properly interpreted and support the conclusions. The authors should be commended for this impeccable research.

Minot point:
The authors need to carefully read through the manuscript and correct some errors of English grammar and spelling.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
