Reviewer's report

Title: Overexpression of GOLPH3 is associated with poor prognosis and clinical progression in pancreatic ductal adenocarcinoma

Version: 2 Date: 6 May 2014

Reviewer: Hua HL Lu

Reviewer's report:

This study describes that the up-regulation of GOLPH3 in pancreatic ductal adenocarcinoma is well correlated with several clinical features in PDAC, including clinical stages, T or N classification, liver metastasis and patient survival, and therefore could be a potential prognostic factor and therapeutic target for this type of human cancer, though it has also been shown to be highly expressed in other types of human cancers. The studies are well designed, and data is convincing. The manuscript is well written, though there are several typos that need to be corrected.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:

No, 'I declare that I have no competing interests'.
