Reviewer's report

Title: Men's knowledge and Attitudes Towards Dietary Prevention of a Prostate Cancer Diagnosis: a qualitative study

Version: 1 Date: 19 June 2014

Reviewer: David Johnson

Reviewer's report:

Discretionary Revisions:

1. No mention in the limitations that all patients were married. This is significant taking into account the potential influence of a partner on perceptions of willingness to adopt dietary modifications. Potential (and likely) partner effect should be addressed.

2. Potential selection bias of the responses by men willing to participate in a randomized trial of nutritional intervention for prevention of prostate cancer, which may differ greatly from the typical male patient at increased risk for prostate cancer is not mentioned.

General comments:
Otherwise, a very well written and important step towards a better understanding of whether targeting potentially beneficial dietary interventions for the prevention of prostate cancer are feasible, and what patient-level factors make interventions more or less effective. Methodology and data reporting are sound,

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
