Title: Does Colon Cancer Ever Metastasize to Bone First? A Temporal Analysis of Colorectal Cancer Progression.

Version: 1 Date: 15 April 2009

Reviewer: Tzu-Chen Yen

Reviewer's report:

The enormous potential of FDG PET in oncology has become evident in recent years, though it started as a diagnostic tool. The present study further expands the possible roles of FDG PET in cancers progression and may benefit for clinicians from an equivocal or an unusual lesion observed by FDG PET. My overall impression is that the study is carefully thought out and that the manuscript is well written and prepared thoroughly, especially for a medical student. Therefore, my comment is no need for revision.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
