Title: Cyclosporine A 0.05% Eye drops for the Treatment of Subepithelial Infiltrates After Epidemic Keratoconjunctivitis

Version: 1 Date: 20 May 2012

Reviewer: Eszter Szalai

Reviewer’s report:

The authors reported a paper "Cyclosporine A 0.05% Eye drops for the Treatment of Subepithelial Infiltrates After Epidemic Keratoconjunctivitis." The topic is not really new; there are a couple of studies reporting the effectiveness of CsA topical treatment in adenoviral epidemic keratoconjunctivitis. The main aim of the present study was to assess the efficiency of topical 0.05 % CsA in the management of corneal subepithelial infiltrates. Authors concluded that topical 0.05 % CsA treatment is a safe and effective in eradicating the symptoms of adenoviral keratoconjunctivitis even in steroid resistant cases. My comments follow.

Major Compulsory Revisions:

As authors mentioned in the manuscript, the main limitation of their study design is the lack of control group. It is hard to draw any conclusion without comparing their patients results to those treated with other medication or with no treatment. This limitation should be discussed in more detail.

Minor Essential Revisions:

Grammatical and spelling errors need to be corrected.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:

I declare I have no competing interests.
