Title: Late-Onset Secondary Pigmentary Glaucoma Following Foldable Intraocular Lenses Implantation in the Ciliary Sulcus: A Long-term Follow-up Study

Version: 3 Date: 5 May 2013

Reviewer: Luca M Rossetti

Reviewer’s report:

The paper is an interesting contribution about onset of secondary pigmentary glaucoma after cataract surgery complications. The subject is well-known, but type of patients and follow-up duration make this a valuable contribution. My comments are the following:

- Methods: patients with a diagnosis of primary pigmentary glaucoma were excluded. Did the authors perform just a gonioscopy of the fellow eye in order to rule this out?
- Methods: please define initial and final IOP
- Did the authors have any information about preop IOP in the 10 patients?
- Results: please describe IOP elevation.
- How often were the patients checked after cataract operation? Please report this in the methods.
- Patients might have IOP elevation also due to other reasons, e.g. inflammation, iritis, presence of vitreous in the angle, angle damage after bad positioning of the IOL haptic, etc. Please discuss.
- The discussion about management of cataract surgery complications is very interested but can be shortened.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
