Reviewer's report

Title: Recurrent Symptomatic Intraocular Pressure Spikes during Hemodialysis in a Patient with Unilateral Anterior Uveitis: case report

Version: 1 Date: 19 November 2012

Reviewer: Jaime Levy

Reviewer's report:

MINOR ESSENTIAL REVISIONS

Case presentation
1. Did the patient have any previous uveitis episodes?
2. Please provide details of fellow eye.
3. Did the authors find any gonioscopic differences between the right and left eye?
4. Was there any difference in the hemodialysis protocol over the last years?
5. The treatment between HD sessions needs to be clarified (steroid drops and anti-glaucomatous treatment).
6. Was there any iris atrophy developing during follow-up period?

Discussion
1. Do the authors think that the HD triggered the uveitis and subsequently the high IOP?
2. Please provide the differential diagnosis for hypertensive uveitis related or unrelated to the hemodialysis.
3. May the authors provide some explanation for the disappearance of the uveitis after trabeculectomy.
4. Please discuss on the unilateral occurrence of the intraocular high pressure besides the outflow facility.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
