Reviewer's report

Title: New Side-view Imaging Technique for Observing Posterior Chamber Structures During Cataract Surgery in Porcine Eyes

Version: 2 Date: 7 May 2013

Reviewer: Roland Ackermann

Reviewer's report:

Minor Essential Revisions:
1. The authors added time stamps to the revised version of Fig. 3. However, their statement that the fluctuations of the IOPs were similar for both groups (l192) is even less convincing now, in particular, as this is the only comment on the IOP records. For example, the graphs "A" and "B" look similar for both groups, but "C", "D" and "F" show a quite different shape. Moreover, the peak IOP occurs at comparable time stamps for "C" (~ 50 s), but there is a difference of 40 s for "D". The authors should discuss the results of Fig. 3 and point out the particular benefit of presenting the IOP records for both groups.

Discretionary Revisions:
1. The phrases "Then, the eyes were allowed to sit [...]" (l117) and "[...] and set for 3 minutes [...]" (l348) should be checked. They sound odd.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
