Reviewer's report

Title: Subtenon injection of natural leukocyte interferon alpha-2a in diabetic macular edema: a case report

Version: 1 Date: 20 September 2013

Reviewer: Ziad Bashshur

Reviewer's report:

This is an interesting case report with significant improvement in macular edema.

Minor Revisions:
1) It is mentioned in the Background that anti-VEGF treatment shows little benefit. Actually, this statement is misleading. There was significant benefit compared to focal laser but the treatment had to be frequent and over a long period.

2) The authors need to tell us what is different in this case compared to the previous publication they had.

3) It would be a good idea to crop the image in figure 2 to leave only the OCT so that the other information does not appear.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
