Reviewer's report

Title: Visual improvement following glaucoma surgery: a case report

Version: 2
Date: 4 September 2014
Reviewer: Luciano Quaranta

Reviewer's report:

I would like to plaude the authors for their effort, but I have some difficulties to believe that a patients with 50 mmHg IOP has no sign of corneal edema. Nevertheless, in order to have a proof of that it should be helpful to have corneal imaging (e.g. OCT or Pentacam) before and after surgery. Moreover it would be nice to have optice nerve head imaging (HRT or OCT) and VF before and after surgery. Please cite and discuss two recent paper related to this topic:

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
