Reviewer’s report

Title: Retinal artery occlusion as the only manifestation of left atrial myxoma: a case report

Version: 2 Date: 12 September 2014

Reviewer: Dieter Schmidt

Reviewer’s report:

The manuscript is written in a suitable, correct way. However, I recommend that the authors should mention - in addition- that myxoma may cause several other ocular problems and not only central retinal arteries occlusions or branch retinal artery occlusions. In the publication by Schmidt et al. that was quoted by the authors of the manuscript, they can find additional ocular changes, for instance homonymous hemianopia or ocular motility disorders.
