Title: Quantitative Analysis of Macular Contraction in Idiopathic Epiretinal Membrane

Version: 1 Date: 24 February 2014

Reviewer: Murat Karacorlu

Reviewer's report:

The authors present a small prospective case series of patients who underwent vitrectomy for idiopathic epiretinal membrane (ERM). The aim is to quantify the displacement of macular capillaries using an infrared fundus photograph who underwent vitrectomy and to analyze the correction between vessel displacement and retinal thickness. As expected after surgery, macular thickness (tomographic parameters) and vascular distortion (topographic parameters which is new) showed significant improvement; correlation was observed topographic and tomographic changes.
