Title: Comparative evaluation of diode laser versus argon laser photocoagulation in patients with central serous retinopathy: A prospective, randomized clinical trial

Version: 1 Date: 18 August 2004

Reviewer: Richard R Wormald

Reviewer's report:

Thank you for asking me to review this report - it seems to be a well written and presented study

a few points only

This is a pilot study with no formal power calculation and should be entitled as such - in other words a "a pilot randomised controlled trial"

There needs to be a clear statement about ethics or IRB approval.

Was there any attempt to mask patients or the assessors of outcome to the intervention?

The authors should clearly acknowledge that this was a small pilot in the discussion and the only conclusions that should be drawn from it is that the may be an effect and a properly powered definitive trial should be undertaken.
