Reviewer's report

Title: Hypnosis-Associated Blue-Tinted Vision: A Case Report

Version: 1 Date: 5 October 2005
Reviewer: David Spiegel

Reviewer's report:

General
Intriguing case report of an alteration in visual color processing during repeated sessions of hypnosis.

-------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)
Clarify that, despite reports that sildenafil can produce blue-tinted vision, the patient was not aware of this possibility, nor was such an expectation conveyed by any of his doctors.
More explicit discussion of the role of parasympathetic activation in maintaining an erection. Is there data on other evidence of effects of the hypnotic state on the patient's autonomic function, e.g. heart rate or blood pressure?

-------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

-------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

What next?: Accept after minor essential revisions

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No
