Reviewer's report

Title: Epidemiological characteristics of Candida species colonizing oral and rectal sites of Jordanian infants

Version: 1 Date: 5 April 2011

Reviewer: mamatha Ballal

Reviewer's report:

1. Lots of grammatical errors in the manuscript which has to be modified completely

2. Under mycological investigation: human blood agar was used for the demonstration of beta hemolysin activity. But the best preferred blood agar is sheep blood agar which gives the excellent result and as no inhibitory substances in it as we see with human blood agar.

3. Some of the tables related to species of candida can be represented by graphic presentation.

Level of interest: An article of limited interest

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
