Title: Caregiver-Reported Adherence to Antiretroviral Therapy among HIV Infected Children in Mekelle, Ethiopia

Many thanks for your response.
I feel that the model building in the multivariate analysis fail to adequately address well. Previously, I have commented but fail to revise it again. It is only marital status and religions of the caregivers were significantly associated with adherence at bivarite analysis. But it is listed as five variable that were included despite some of the variables have no biological plausible evidence to put in the model building.

Regards,
