Advice on publication: Other (see below)

I have reviewed the manuscript "Adenovirus Type 7 associated with sever and fatal acute lower respiratory infections in Argentinian children". In spite of the bias inherent to the retrospective type of study and the fact that the study was done 10 years ago, I think that according to the editorial policy stated in the mail, there is some information worth of communication. The formal presentation of the manuscript need minor corrections. I suggest to shorten the list of signs and symptoms in Table 2, limiting them to the more reliable and relevant signs. It should be also better if it were complemented with a column with information about the total of 168 cases studied. Furthermore, I am not aware of the editorial policy in relation to the titles of cited journals in references.
