Level of interest: A paper of considerable general medical or scientific interest

Advice on publication: Accept after discretionary revisions

This paper clearly demonstrated that children with post-varicella ataxia have unique autoantibodies to centrosome components, although a direct causal relation is not unknown. There are a few minor points which need to be addressed.

1. P4, line 5 from the bottom: "and" is overlapping.
2. P7, line 4: It would be better to insert the percentage (25%) of anti-Mob-1 Ab.
