Reviewer's report

Title: Risk of Cardio-Respiratory Dysfunction in Preterm Infants Placed in Car Seats: A Cross-Sectional Study

Version: 4 Date: 29 April 2005

Reviewer: alistair gunn

Reviewer's report:

General

-------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

-------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

-------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

The authors have satisfactorily addressed all of the issues raised by the reviewers. The paper is now clear, and presents its results effectively.

There are a few minor points that the authors may wish to consider.

The commentary states that the 3d formatting of the figure has been removed. In the figure available to me however, it has not. This is a stylistic element and as such is between the editors and the authors. However, it is commonly discouraged because it has no benefits, and makes it more difficult to compare columns.

Footer of tables 1 and 2. "combination of any cardio-respiratory symptoms" should be "Presence of any " etc.

Methods. give city, state/country for all equipment, e.g. the car seat, the oxford medilog etc.

results.
"there was _a_ significant "...

Discussion, para 1.
should 'that is dependent on' be 'that seemed to be related to '?

Discussion, last para, final sentence.
suggest "which was associated with reduced frequency of oxygen desaturation"...

What next?: Accept after discretionary revisions

Level of interest: An article of importance in its field
Quality of written English: Acceptable

Statistical review: No
