Reviewer's report

Title: Parents knowledge, attitude and behaviour concerning sunning their babies; a cross-sectional, descriptive study

Version: 2 Date: 18 September 2006

Reviewer: Jean-François Doré

Reviewer's report:

General
As mentioned earlier, I found this in itself is an interesting study since there are still quite few reports of parental behaviour regarding sun exposure of infants and children, but the analysis was limited. This second version of the manuscript has been profoundly modified. All major comments have been met by the authors.

-------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)
All major comments have been met or justified: the questionnaire has been added, the question on benefits of sunlight on neonatal jaundice has been justified and the authors have added information on prevalence of rickets in this population.

-------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)
OK

-------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)
OK

What next?: Accept without revision

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No
