Point-of-Admission Hypothermia among High-Risk Nigerian Newborns

This is cross sectional study of the prevalence of hypothermia on admission to a teaching hospital in Nigeria. Hypothermia was found to be common in both inborn and outborn infants.

The study was well carried out. The methodology is appropriate for the type of study and the data analysis is robust.

The paper is clear and the results are well laid out. The discussion adequately deals with the key findings and the conclusions are reasonable.

In my opinion this is a well written paper describing an interesting study and merits being published.
