Reviewer's report

**Title:** Relationship of family caregiver burden with quality of care and psychopathology in a sample of Arab subjects with schizophrenia

**Version:** 2  **Date:** 13 July 2010

**Reviewer:** Setsko Hanzawa

**Reviewer's report:**

This theme in the field of “family caregiver burden with quality of care and psychopathology” is important in Arab subjects as Muslim culture, with traditional gender roles and sexual segregation, and the extended family system and family social support are the norms, as authors’ comments of "The setting of Method" in this article in page 6, which has been similar to our Asian countries. The results of the article are worthy of publication in order to discussion mental health and support programs toward caregiver with schizophrenia outpatients in Arab.

Next study about variables like “patient’s disruptive behavior” as authors’ comments of “conclusion” in page 24 would be expected. If you have minor essential revision in Table 2, it may be easy to understand.

**Level of interest:** An article whose findings are important to those with closely related research interests

**Quality of written English:** Acceptable

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
