Research artiche

The issue discussed by the Authors is of interest for those working in the field. The Authors themselves underscore that in 13 years they were able to identify only 20 subjects with comorbid T1DM and ED, out of a sample of 1887 patients. Anyway, a deeper understanding of the possible psychopathological and outcome differences between ED and ED+T1DM may be helpful in planning treatment interventions.

Some suggestions for minor revisions:

1) check the manuscript for typing errors (e.g. Background section, missing full stop after [2,3]; Results section, third paragraph, missing bracket (less self-perceived intensity of the ED and less perceived impairment.).

3) In the discussion, please expand on the differences in self-harm and suicidal behaviours between the two groups.

Level of interest: An article whose findings are important to those with closely related research interests
Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
