White Matter Abnormalities in Adolescents with Generalized Anxiety Disorder: a Diffusion Tensor Imaging Study

The results and related statistics are presented clearly. The figure could convey more information by coding the significant voxels in relation to the associated T or p values. Furthermore, as the age difference between the two groups reaches marginal significance (p=.08) it would be interesting to see if the presented results are independent of age.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
