Reviewer’s report

Title: Metabolic risk factors profile associated with use of second generation antipsychotics: a cross-sectional study in a community mental health centre

Version: 2 Date: 17 December 2005

Reviewer: Paul Mackin

Reviewer’s report:

General

The manuscript is improved, but I remain concerned that the study design and statistical analysis doesn't allow for easy interpretation of the data.

------------------------------------------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

There have been multiple statistical tests performed on a number of outcome variables. Can the authors confirm that they have corrected for multiple testing?

------------------------------------------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

There are many grammatical errors and examples of ideosyncratic use of English. These should be corrected.

------------------------------------------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

What next?: Unable to decide on acceptance or rejection until the authors have responded to the major compulsory revisions

Level of interest: An article of limited interest

Quality of written English: Needs some language corrections before being published

Statistical review: No
