Title: The relationship between facial skeletal class and expert-rated interpersonal skill: an epidemiological survey on young Italian adults

Version: 3 Date: 2 August 2006

Reviewer: Jeremy Miles

Reviewer's report:

The statistics look fine. Having a small sample is an explanation for not finding a statistically significant result (a type II error) when one should have found one. It is not an explanation for finding a significant result when one should not have found one (a type I error). The type I error rate is always 5%.
