Title: A modelled economic evaluation comparing atomoxetine with methylphenidate in the treatment of children with attention-deficit/hyperactivity disorder in Spain

Version: 2 Date: 14 January 2009

Reviewer: Hans Steiner

Reviewer's report:

The most recent submission of the current study - emphasizing the cost-effectiveness of atomoxetine compared to methylphenidate (MPH) in the treatment of ADHD among children and adolescents - has been considerably revised.

Major points of criticism suggested in our previous review have been sufficiently addressed. One additional sentence in terms of ethics committees' approvals of clinical trials, which have been synthesized for the current study, might be relevant.

Eventually, we don’t recommend any further major revisions and suggest the current study for publication.
