Reviewer's report

**Title:** Parent and child physical activity and sedentary time: Do active parents foster active children?

**Version:** 2  **Date:** 23 March 2010

**Reviewer:** Alison Field

**Reviewer's report:**

The revised manuscript is much improved. Given how much the results changed when inactivity was classified in 3 groups, instead of 2, it makes the reviewer wonder whether a sensitivity analysis was done to determine how sensitive the results are to other other classifications.

Small changes that should be made include:

- change RRR to RR. Relative risks are ratios, thus relative risk ratio is redundant and not the common terminology.

- if one presents a 95% CI, one doesn't need to also show a p-value.

**Level of interest:** An article whose findings are important to those with closely related research interests

**Quality of written English:** Acceptable

**Statistical review:** Yes, and I have assessed the statistics in my report.
