Reviewer's report

Title: Home-based voluntary HIV counselling and testing found highly acceptable and to reduce inequalities

Version: 2 Date: 9 December 2009

Reviewer: carla obermeyer

Reviewer's report:

The authors have addressed the comments that I had sent in my earlier review. I still think that a statistician should make sure that the appropriate tests have been applied and interpreted properly, and that the text should be revised with the goal of increasing clarity and improving grammar. Because of these points, I have checked discretionary revisions, but I believe it is up to the editors to make sure this is done--ie the authors have tried to do all that they could reasonably do.

The data are now quite old, since as it turns out, the survey was conducted in 2003, but since there are not too many studies of home-based VCT, it should still be of interest.

I have no further comments

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.

Declaration of competing interests:
