Title: Health promotion in mental health care: design and baseline findings of a cluster preference randomized controlled trial

Version: 2 Date: 31 May 2012

Reviewer: Benjamin Vicente

Reviewer's report:

I have reviewed the above study protocol which seems an interesting attempt to foster and test promotion strategies in health care.

The sample and hypothesis are well described and the design is adequate to test them.

The propose interventions are also simple and can be easily replicated as well as the outcome measures (BMI WC, QOL).

Finally overall design, method and writing seems appropriate.
