Reviewer’s report

Title: Prevalence and correlates of hyperglycemia in a rural population, Vietnam: implications from a cross-sectional study

Version: 1 Date: 29 August 2012

Reviewer: Eiji Takeda

Reviewer’s report:

This manuscript is very interesting and important, because this data show prevalence of hyperglycemia in a rural population in Vietnam and may lead to develop the diabetes mellitus prevention model in Vietnam. However, several comments are raised as below.

1) Blood glucose levels were measured in the central laboratory of the Ha Nam Center for Preventive Medicine after preparation of plasma, stored at 2-8 C and transported. Did you confirmed that glucose levels was not changed during this process?

2) The explanation on lines 19-23 in page 8 is difficult to understand. Please clarify it.

3) GOTT in page 12 should be OGTT.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable
