Reviewer’s report

Title: Did Past Economic Prosperity Affect the Health Related Quality of Life Predictors? A Longitudinal Study on a Representative Sample of Slovenian Family Medicine Patients

Version: 2 Date: 14 September 2013

Reviewer: Prin Vathesatogkit

Reviewer’s report:

1 The data sounds more reasonable after the authors have changed their analyses. Now I’m wonder whether participants’ economic status do really affect PCS at 6th and 12th month. (I assume that the 'non-Bold' b-coefficients in table 5 mean that they are not statistically significant.) But a strong association between economic status and MCS is now clearly showed.

2 The flow chart is clearly demonstrated in Figure 1

3 I agree with the changed the authors have made. To focus more on the evidence they collected and give less weight on factors that were not in the analytic models.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
